

Pumping system

Carefully pumping of fish from pier or pontoon / ship to the processing plant.

We offer PV-systems to be placed on-board vessels, the pier or at floating pontoons far away from shore, where the fish is pumped via a submerged pipeline to the De-watering box, where after the fish either goes to truck or directly into the processing plant. Depending on the conditions we offer our pumps with Turbo Device or as Long Distance pumps.

We have double tank models, which can pump up to 600 t fish/h and distances up to 2000 m. Most of our PV-systems are available with electric, hydraulic or diesel driven units.
