

Dewatering systems

Dewatering boxes are used for separating water from fish where fish are taken to further processing and the RSW water back to the tank.

Dewatering system can be used in different contexts:

- Pumping of fish from boat to onshore facilities.
- Pumping internally in a factory for pumping round fish or fillets. The dewatering box takes the water back to the tank and flushes the fish/fillets towards the suction funnel. This may be smaller systems and larger with suction pipes up to 450mm.

It is important that the design of the dewatering box is adapted to the fish species to be pumped and that the water is separated out in a satisfactory manner.
