

FP Control system

From Man-Machine user interface to online web based support and surveillance

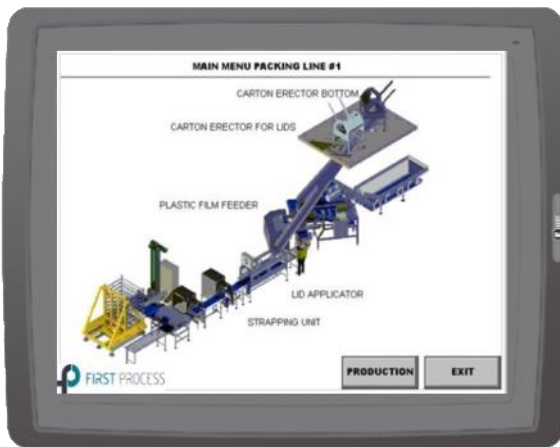

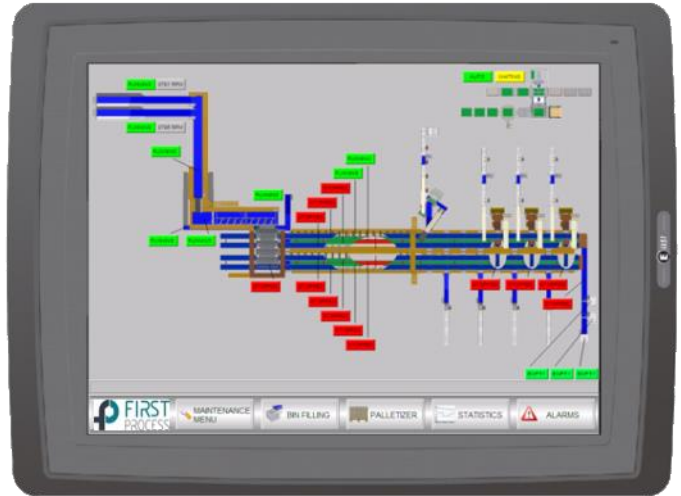

FP Control system

Smart, tailor-made solutions for Your setup

FP Control System:

Our control systems are designed for easy controlling the fish handling. All systems are shown graphically as system drawings, and different operations are operated from separate views. From touch screen panels, the operator can observe and run all functions for the fish handling system, the packing lines, and the palletizing system.

Process Visualization System:

The Process Visualization System has been integrated as an intuitive system for assisting customers in the daily use.

The system shows operators the status for each machine, and can also be viewed remotely.
