

Distribution system

From grading to manual grading, packing, storage or fileting

Conveyors

With 3D design and high tech production technology, we have developed conveyor systems with the highest grade of hygiene and quality.

Open structure

The conveyor is designed with an open structure to keep all parts of the frame visible. When washing the conveyor the personnel can see all parts of the frame and the belt, and it is not necessary to dismantle the equipment to keep a high level of hygiene. We have used water cutting technology to make profiles that is connected without bolts and nuts, and the usage of smart connections keeps the design open and hygienic.

Stainless steel - pickled

We always prefer that the stainless steel is pickled after manufacturing to perform the best corrosion resistance.
